SNEPR

MASTER COMPANY, PRODUCT, OPERATIONS & EXECUTION REPORT

THE COMPLETE WORKING BLUEPRINT

Brand identity • Product strategy • Customer journeys • Salon operations • Queue engine • AI Smart Styling • Subscription plans • Marketing • Launch execution

Prepared 5 November 2026 | Bhubaneswar-first launch plan | Working master document

Website: www.snepr.in | Contact shown in the working landing-page materials: hello@snepr.in

DOCUMENT CONTROL & HOW TO READ THIS REPORT

This document consolidates the Snepr decisions, product concepts, operating flows, brand assets, subscription structure, marketing material, prototype behaviour, market-planning notes and execution recommendations available in the working project materials and prior discussions. It is intentionally detailed so a founder, developer, designer, salon owner, staff member or new team member can understand the project without needing the earlier conversations.

Important status rule: This report distinguishes (1) confirmed decisions made in the project discussion, (2) features specified or proposed for development, (3) prototype/demo content, and (4) unresolved decisions. A feature appearing here does not automatically mean it is already live in production.

Status labels used throughout

- CONFIRMED DECISION — A choice explicitly made in the latest project discussion.
- WORKING SPECIFICATION — A defined product behaviour or feature that still needs implementation/testing.
- PROPOSED / FUTURE — A useful feature or roadmap item that has not been confirmed as live or final.
- DEMO / ILLUSTRATIVE — A prototype screen, sample value, mock salon, mock queue or concept artwork; not real operational data.
- OPEN DECISION — A detail that must be settled before development, billing, onboarding or public claims.

Contents

- 1. Executive summary and what Snepr does
- 2. Brand foundation, exact logo system and visual rules
- 3. Approved taglines, hooks and campaign language
- 4. Product concept, audiences and value proposition
- 5. Customer app: every customer-facing module
- 6. Salon owner/staff product and operating dashboard
- 7. Queue management: complete operating logic
- 8. Appointments and service catalogue
- 9. AI Snepr Studio: catalogue, plan access and safety
- 10. Public barber ratings, reviews, Snepr Points and separate add-ons
- 11. Final subscription plans and feature entitlements
- 12. End-to-end operating procedures and exception handling
- 13. Technical architecture and prototype status
- 14. Maps, location, GPS and route experience
- 15. Salon onboarding, support and quality control
- 16. Bhubaneswar market entry and prospect research
- 17. Business model, pricing logic and unit economics
- 18. Marketing strategy and exact pre-launch calendar
- 19. Day 1 Hinglish Reel: chosen hook and production brief
- 20. Snepr Originals: The Last 10 Minutes, Season 1
- 21. Social media production and publishing operations
- 22. Rollout roadmap, testing and launch gates
- 23. Privacy, security, trust and responsible AI
- 24. Metrics, risks and mitigations
- 25. Open decisions and master checklist
- Appendices: terminology, source materials and operating glossary

1. EXECUTIVE SUMMARY

Snepr is a salon discovery, queue-visibility and salon-management platform. It connects two sides of the salon visit: customers who want to discover a suitable salon and avoid uncertain waiting, and salon owners/staff who need a simple way to manage walk-ins, remote queue entries, appointments, services and daily operations.

THE BASIC OPERATION

Snepr helps customers discover salons, check queues, compare services and prices, and join a salon queue or book an appointment—while salons manage customers, staff and queue progress through a digital dashboard.

The central problem

- Customers often travel to a salon without knowing how busy it is, how many people are ahead, or how long they may wait.
- Customers may have to ask staff repeatedly for an update or physically remain at the salon just to hold their place.
- Salon owners often manage walk-ins through verbal instructions, paper notes, phone calls or informal memory.
- Staff need a simple way to keep the queue current while serving customers.
- Customers also need trustworthy information about services, prices, barbers, reviews and the salon itself.

Snepr's solution

- Salon discovery and salon profiles in one customer-facing experience.
- Service catalogue with prices and estimated durations, where verified by the salon.
- Digital queue joining through manual staff entry, QR scan or remote joining through Snepr.
- Backend-generated queue tokens and a salon dashboard to manage the queue lifecycle.
- Live queue visibility, estimated turn-time range and turn notifications in Intermediate and Pro.
- AI Smart Styling, with different entitlements by subscription tier.
- Public barber ratings/reviews and customer engagement concepts such as Snepr Points.
- Business analytics and advanced operational tools for higher subscription plans.

The two audiences

Audience	What they need	Snepr's promise
Salon customers	Find a salon, know service/pricing information, join or book, track queue progress, get turn alerts, discover styles.	Know the Queue Before You Go.
Salon owners/managers/staff	List services, manage queue and appointments, assign staff, communicate with customers, understand operations.	Run the salon with clearer digital operations.

Current working commercial plan

Entry ₹199/month • Intermediate ₹400/month • Pro ₹449/month. These are the latest agreed working prices in the project conversation. GST, billing terms, annual plans, refund/cancellation terms, usage caps and exact limits still need final approval.

Launch geography

Bhubaneswar is the first market. The earlier acquisition research recommends starting with a tight Patia–KIIT Road–Infocity micro-cluster, then expanding area by area after the queue workflow and salon update behaviour are reliable.

2. BRAND FOUNDATION & EXACT LOGO SYSTEM

The approved direction is warm, premium, modern, rounded and understated. Snepr should feel polished and approachable—not loud, overdecorated or excessively 'elite'. The original rounded wordmark is the primary brand asset. The signature three-bar bronze E is the recognisable brand device.

Chosen logo board

The board above is the selected Snepr identity direction: primary rounded wordmark, compact secondary wordmark, S-plus-three-bar submark and app/favicon icon.

Exact selected logo structure

- Primary logo: Original rounded 'Snepr' wordmark in espresso/dark brown, with the E represented by three stacked horizontal bronze bars. This is the main logo for the website, official communication and brand-led creative.
- Secondary logo: Compact wordmark using the same rounded lettering and three-bar bronze E. Use for social layouts, merchandise, campaign artwork and compact placements.
- Submark: Bold espresso S paired with the three bronze bars (S + three-bar E device). Use for avatar, watermark, signage and quick recognition.
- Favicon/app icon: Rounded-square espresso tile with an ivory S and bronze three-bar mark. Use in app icons, browser favicon and small digital placements.
- Reverse logo: Light/ivory wordmark with the bronze E mark on dark espresso backgrounds. Keep the same proportions and logo construction.

Colour palette — exact hex values

Colour	Hex	Use
Espresso	#2B1A0F	Primary dark text, wordmark, dark backgrounds and strong contrast.
Bronze	#B56A2C	Signature three-bar E, accents, highlights and key details.
Ivory	#F7EFE6	Main warm background and light brand surfaces.
Sand	#E7D8C8	Secondary neutral, panels and soft dividers.

Typography

- Rounded headline font: Poppins or Nunito / Nunito Rounded. Verify exact font availability and commercial licensing before production.
- Supporting UI font: Inter or DM Sans.
- Use strong, readable typography and generous whitespace. Premium comes from restraint, composition and legibility.
- Older visual explorations included serif-like or hairline wordmarks. They are not the chosen primary direction; retain the original rounded wordmark with the three-bar bronze E.

Logo use rules

- Do not replace the primary rounded wordmark with a serif logo.
- Keep the bronze three-bar E consistent in all official logo versions.
- Preserve proportions, spacing and clear space around the mark.
- Use the reverse version on dark backgrounds.
- Use the submark for small placements; do not force the full wordmark into tiny spaces.
- Do not add arbitrary gradients, outlines, shadows or effects to the logo.
- Use the approved asset file rather than redrawing or distorting it.

Production asset qualification

The earlier brand starter kit includes transparent PNGs, reverse logo, app icon variants and SVG starting-point approximations. The SVGs are editable starting points with font fallbacks, not exact vector tracings of the final custom lettering. Before print, trademark filing, app-store production or large signage, convert the approved lettering into clean vector outlines and validate spacing at final size.

3. APPROVED TAGLINES, HOOKS & CAMPAIGN LANGUAGE

Use the lines below according to their role. They are not interchangeable: one is the master brand tagline, one explains the functional product value, and others are campaign hooks or creative variants.

A. Master brand tagline — selected

“Your Time. Your Style. Your Snepr.”

This is the chosen brand promise and should be used consistently on the website, brand communications, campaign end cards and launch material.

B. Functional product message — selected

“Know the Queue Before You Go.”

This is the clearest product explanation for customers. It communicates the queue visibility benefit without needing a long description.

C. Campaign platform — selected

“Question Everything”

The campaign platform for the curiosity-led pre-launch period. The first stage is designed to make people feel the universal frustration of waiting before explaining the salon product.

D. Day 1 Hinglish hook — selected creative

“Waqt tumhara hai. Phir wait kyun?”

Chosen Day 1 Reel headline. It is intended to feel emotionally relatable, premium and shareable.

E. Day 1 core message — selected

“Some things deserve your time. Not everything deserves your wait.”

F. Mystery campaign teaser — selected calendar wording

“You wait. You wait some more. But why?”

G. Other approved/used creative lines

- “The hardest part isn't waiting. It's not knowing how long.”
- “Your turn will come. They said.”
- “Some queues don't have a number. Just patience.”
- “How much of your life have you spent waiting?”
- “You've waited long enough. Meet Snepr.”
- “You had plans. The queue had other plans.”
- “Time should be yours.”
- “What if you knew before you went?”
- “A haircut shouldn't take your entire afternoon.”
- “Your time is valuable. Your salon experience should respect it.”
- “The waiting game is about to change.”
- “Meet Snepr. Your Time. Your Style. Your Snepr.”

H. Day 1 voiceover phrases

- “Waqt tumhara hai...”
- “Phir bhi...”
- “Har baar wait kyun?”
- “Hum kitna waqt... bas wait karte hue guzaar dete hain?”
- “Har wait galat nahi hota.”
- “But your time has value. Some things deserve your time.”

- “Not everything deserves your wait.”
- “Something is changing.”

I. Other explored creative lines — not the master tagline

- “Know. Book. Walk In.”
- “Good hair doesn't wait.”
- “Check. Book. Walk in. That's it.”
- “No waiting. No guessing. Just Snepr.”
- “Arrive Differently.”
- “Your time deserves better.”
- “The experience begins before you arrive.”
- “Less waiting. Time looks better on you.”
- “Discover. Queue. Book.”
- “A More Predictable Salon Visit.”

Usage hierarchy

Brand identity: Your Time. Your Style. Your Snepr. | Functional explanation: Know the Queue Before You Go. | Curiosity campaign: Question Everything / The Waiting Game | Day 1 emotional hook: Waqt tumhara hai. Phir wait kyun? | Day 1 core message: Some things deserve your time. Not everything deserves your wait.

4. PRODUCT CONCEPT, AUDIENCES & VALUE

Snepr is positioned as a salon discovery and queue-visibility platform with a salon operations layer. AI style discovery complements the core queue proposition; it does not replace the reliability of queue data.

Customer value

- Find salons by area, category, service or name.
- Compare salon profiles, services, prices, opening hours and barber/stylist information where verified.
- Understand queue conditions before travelling, in plans where customer-facing live queue visibility is enabled.
- Join a queue manually through staff assistance, by QR scan or remotely through Snepr.
- Receive a token and track status.
- See an estimated turn-time range in Intermediate and Pro.
- Receive notifications when a turn is approaching or ready, where delivery channels are enabled.
- Explore hairstyles and grooming inspiration through AI Snepr Studio according to plan entitlement.
- Browse barber ratings and verified reviews, save favourite salons and return to visit history.

Salon-owner value

- Create and maintain a salon's public digital profile.
- Publish service categories, prices and estimated service durations.
- Accept queue entries through all supported joining methods.
- Keep one queue source of truth for customers and salon staff.
- Manage waiting, called, in-service, completed, cancelled and no-show cases.
- Assign customers to staff/barbers and later manage chairs/branches as plan features permit.
- Handle appointments separately from walk-in queue capacity.
- See daily operations and, in higher plans, reports, queue analytics and business insights.

Product principles

- Public salon and barber browsing, ratings and review reading should be available without forcing login.
- Ordinary queue tokens should be created by the backend. Staff manage progress; they should not need to manually invent token numbers.
- Subscription tiers must not buy better public ratings or manipulate barber reputation.
- Reward honest verified reviews equally regardless of star rating.
- AI previews are inspiration, not a guarantee of the actual salon result.
- Plan entitlements and usage limits must be enforced on the backend, not only hidden in the UI.
- Customer and salon views should use the same shared backend state for queue information.
- Do not present mock queue values, mock ratings, mock salons or prototype UI as live product data.

5. CUSTOMER APP — COMPLETE MODULE BREAKDOWN

The working customer-app prototype contains four primary navigation areas: Explore, My Queue, AI Studio and Profile. The current HTML prototype is an illustrative front-end artefact; backend connections and real data sources must be verified before public launch.

A. Explore / salon discovery

- Hero area with the customer-facing value message and salon discovery call to action.
- Area selector: Patia, Jaydev Vihar, Saheed Nagar, Chandrasekharpur, KIIT Square and Rasulgarh appear in the prototype.
- Search salons, services or barbers by text.
- Use current location where the customer grants location permission.
- Filter by All Salons, Barbers, Unisex, Beauty and Open Now.
- Map view / salon pins as a discovery concept.
- Salon cards can show salon name, category, locality, distance after location access, rating, service price starting point and queue indicator.
- Salon details include service menu, prices, barbers/stylists, reviews, opening hours, facilities and queue information.
- Customers can save favourite salons and revisit their profiles.

B. Salon detail page

- Salon name, area/address and verified identity.
- Rating and review count only after data is verified.
- Opening status/hours only from current salon-confirmed information.
- Distance only when the location source is available or a starting point is selected.
- Services and pricing with clear 'from' prices where prices vary.
- Barber/stylist list and profile links.
- Published reviews and review count.
- Live queue information only when the salon is participating and updating its queue.
- Join Queue button with clear queue rules before confirmation.

C. My Queue

- Token number and salon/service name.
- Queue status and progress stages: Joined, Waiting, Your Turn/Called, Service Started/In Service, Completed.
- People ahead and queue position.
- Estimated waiting time where enabled by plan and where data quality supports it.
- Joined-at timestamp and last-updated timestamp.
- Queue activity timeline / recent updates.
- Route to salon and selected starting point.
- Queue rules, late-arrival policy and cancellation action.
- Customer must be told when queue data is stale or estimates are unavailable.

D. Profile / account

- Customer profile and account details.
- Visit history.
- Saved styles.
- Favourite salons.
- Notifications and queue/visit updates.
- Account settings and security.
- Help and support.
- Sign-out.

E. Notifications

- Queue join confirmation.
- Salon notification of a new join.
- Queue movement/status updates.
- Turn approaching and turn called/ready.

- Appointment confirmation/reminder/reschedule/cancellation.
- Review request or review status updates where implemented.
- Offers/campaign notifications only with the correct consent and opt-out.

6. SALON OWNER & STAFF PRODUCT

The salon dashboard is the operating centre for the participating salon. It must be fast and simple enough for reception staff or barbers to use during busy hours.

A. Salon profile administration

- Salon name, category, description and contact details.
- Logo, cover image and gallery photos.
- Address, locality, map pin and service area details.
- Opening and closing hours, weekly schedule and holidays.
- Facilities and salon policies.
- Profile publishing/verification state.

B. Service catalogue administration

- Create service categories and individual services.
- Set price or price range.
- Set expected duration or duration range.
- Set staff eligibility / which barbers can perform a service.
- Enable/disable services and availability.
- Update seasonal pricing and service descriptions.
- Keep menu and duration information current because duration feeds wait-time estimates.

C. Live queue dashboard

- Show waiting, called/ready, in-service, completed, cancelled and no-show entries.
- Show token, customer display name or safe identifier, requested service, joining time and assigned barber.
- Call next customer / call token.
- Start service.
- Complete current service and call next eligible customer.
- Cancel or mark no-show with a reason where appropriate.
- Pause/resume queue joining.
- Set daily queue capacity and closing-time restrictions.
- Assign customer to barber/staff member.
- Show last-updated time and stale-data warning.

D. Staff management

- Create barber/staff profiles and roles.
- Set staff availability, working hours and breaks.
- Assign services to qualified staff.
- View staff-wise queue.
- Track completed services per staff member.
- Pro-level staff performance and utilisation reports.

E. Appointment operations

- View appointment requests and confirmed appointments.
- Accept/reject, cancel and reschedule.
- Set staff-wise availability and appointment slots.
- Prevent overlapping bookings.
- Keep appointment inventory separate from walk-in queue capacity.
- Track appointment statuses and missed appointments.

F. Owner dashboard and reports

- Today's total customers, waiting count and completed services.
- Today's appointments and queue summary.
- Daily/weekly/monthly trends as permitted by plan.
- Staff-wise service count and performance.

- Revenue and service-wise breakdown only when reliable transaction data is captured.
- Queue performance, wait-time and peak-hour insights in Pro.
- Downloadable business reports in Pro.

G. Owner/staff permissions

- Owner can manage profile, services, subscription and staff permissions.
- Manager can oversee queue and appointments within granted access.
- Receptionist can add customers, manage queue entries and appointments.
- Barber/stylist can see assigned queue entries and update service status if authorised.
- Admin/support role can troubleshoot with audited access.
- Role names and exact permission matrix must be finalised before production.

7. QUEUE MANAGEMENT — END-TO-END OPERATING LOGIC

Queue management is Snepr's core operational engine. The goal is to let customers join in multiple ways while the salon controls queue progress from one shared dashboard.

Joining methods — confirmed for all three plans

Joining method	How it works	Plan access
Manual staff entry	A walk-in customer arrives; salon staff enters the customer/service into Snepr. The backend still creates the token.	Entry, Intermediate, Pro
QR queue joining	Customer scans the salon-specific QR code. It opens the salon profile/queue flow; customer selects service and confirms joining.	Entry, Intermediate, Pro
Remote queue joining	Customer joins through Snepr from outside the salon, before travelling. The salon's queue rules and capacity apply.	Entry, Intermediate, Pro

Important distinction

QR joining and remote joining are not the same. QR joining starts when the customer scans a code at the salon. Remote joining starts in the app from another location. Both are available in every subscription plan.

Standard queue journey

Step	Operation
1. Discover	Customer opens a salon profile and reviews services, price and queue rules.
2. Choose	Customer selects the requested service and joining method.
3. Validate	Backend checks salon open/paused state, service availability, queue capacity, duplicate active token and joining rules.
4. Confirm	Customer confirms joining; manual staff entry is confirmed by staff.
5. Token	Backend creates one unique token and adds the entry to the correct salon queue.
6. Notify	Customer sees confirmation/token; salon dashboard receives the new entry.
7. Serve	Staff calls the customer, starts service and completes the entry.
8. Update	Customer and salon views refresh from shared backend state; the event is logged.

Queue token rules

- Generate unique tokens on the backend, not in the browser UI.
- Token creation must be atomic/idempotent so a double tap does not create duplicate queue entries.
- One active token per customer per salon is a sensible default unless the final policy explicitly allows otherwise.
- Token should reference salon, service, customer identity or safe contact key, join timestamp, status, assigned staff and audit events.
- Token numbering format may be salon/day-specific (for example S108) but final numbering rules are open.
- Token expiry and daily reset policy must be defined.

Queue statuses

Status	Meaning	Who updates
Waiting	Customer has joined and is waiting.	System creates; staff may update/cancel.
Called / Turn approaching	Salon is asking the customer to be ready or come forward.	Staff/system notification.
In Service	Barber/stylist has started the service.	Staff/barber.
Completed	Service is finished.	Staff/barber.
Cancelled	Customer or salon cancelled the queue entry.	Customer/staff under policy.
No-show	Customer did not arrive/respond within defined grace period.	Staff under transparent policy.

Salon control actions

- Call Next: call the next eligible waiting token.
- Start Service: move called token into in-service state.
- Complete Current & Call Next: complete the active token and call the next eligible customer in one clear workflow.
- Cancel / No-show: close an entry with a reason and audit trail.
- Pause / Resume: stop new joins while preserving existing tokens.
- Capacity controls: define maximum active queue size and stop joining near closing.
- Manual assignment: assign an entry to a barber/staff member.
- Reorder/priority: only under controlled rules; customer priority queue is a separate feature, not an automatic subscription perk.

7A. WAIT-TIME ESTIMATION, QUEUE TRUST & EDGE CASES

Intermediate and Pro customer-facing experience

Customers should see the live queue position and an approximate time range for when their turn is expected. The agreed display target is plus/minus five minutes. This is a target for the estimation system—not a guaranteed promise to customers.

Example customer display

YOUR SNEPR QUEUE	ESTIMATED TURN
10:35 AM Expected range: 10:30–10:40 AM	3 customers ahead of you

What the estimate should use

- Current queue position and all eligible entries ahead.
- Service type and configured expected duration, preferably based on actual recorded durations over time.
- Whether the salon has one barber or multiple active barbers.
- Which barber/staff member is assigned to each entry.
- Current in-service work and any pause/break state.
- Live changes: service overruns, cancellations, no-shows, new joins, staff becoming unavailable.
- Data freshness timestamp; estimates should be hidden or downgraded when queue data is stale.

Recommended estimate logic — specification, not implemented algorithm

For a single barber, estimate the remaining service time for the customer currently in service plus the expected durations of eligible customers ahead. For multiple barbers, estimate each barber's workload and the next available service slot, then assign/estimate using the salon's rules. Use observed service-duration distributions rather than a single fixed number once sufficient data exists. Present a time range and update it when the queue changes.

Entry plan

Entry includes queue joining and salon-side queue management, but the current agreed plan split reserves customer-facing live queue visibility, predicted turn time and turn notifications for Intermediate and Pro. Entry must still show a clear token/confirmation and should not advertise the paid live-tracking experience.

Queue edge cases that must be specified

- Remote join distance/geofence rule or no distance restriction.
- Whether remote customers must check in on arrival and how.
- Grace period for late arrival and how the queue advances.
- Token expiry and end-of-day cleanup.
- Duplicate joins and repeated confirm taps.
- Queue capacity and pause/resume behaviour.
- Salon closing-time behaviour and handling of remaining tokens.
- Customer cancellation, salon cancellation and no-show.
- Staff permissions for status changes and queue reordering.
- Service duration override and unexpected long services.
- Stale data: show last updated, warn customer, hide/downgrade unreliable ETA.
- Network failure/offline behaviour and how pending status changes reconcile.

8. APPOINTMENTS, SERVICES & SALON CATALOGUE

Snepr has two related but distinct visit mechanisms: (1) a live queue for customers waiting to be served and (2) appointment booking for a future time slot. Appointment capacity must not be silently mixed into walk-in queue capacity.

Appointment management — Entry (basic)

- Receive appointment requests.
- View upcoming appointments and daily list.
- Accept or reject a request.
- Cancel an appointment.
- Display appointment status.

Appointment management — Intermediate and Pro (advanced)

- Manage appointment availability and time slots.
- Set staff-wise availability.
- View appointments by barber/stylist.
- Prevent overlapping/conflicting bookings.
- Manage rescheduling requests.
- Track confirmed, pending, cancelled, completed and missed appointments.
- Show available slots on customer-facing salon profile.

Service catalogue structure

- Service category (haircut, beard, styling, hair colour, hair spa, facial/beauty or other salon-listed category).
- Service name and customer-friendly description.
- Price or price range.
- Estimated duration or duration range.
- Availability and staff qualification.
- Optional service image/reference.
- Last updated date and owner verification.

Why service duration matters

The duration is not only a catalogue detail. It is a key input to the wait-time estimate. Salons should provide realistic durations and adjust them when actual operating conditions differ. Do not promise an exact turn time from a static duration alone.

9. AI SNEPR STUDIO — COMPLETE FEATURE SPECIFICATION

AI Snepr Studio is the style-discovery and grooming inspiration module. It helps customers explore possible looks and connect their preferences to services salons actually provide. It is not a medical or diagnostic service.

Final plan access — latest decision

AI Smart Styling capability	Entry ₹199	Intermediate ₹400	Pro ₹449
Basic AI-powered style recommendations	Not included	Included — 3 attempts	Included; no 3-attempt cap
Photo-based hairstyle recommendations	Not included	Only if included in the basic recommendation flow; final scope to specify	Included
AI hairstyle visualisation	Not included	Not included	Included
Virtual hairstyle try-on	Not included	Not included	Included
Advanced personalised styling	Not included	Not included	Included
All advanced AI styling features	Not included	Not included	Included

Intermediate usage rule

Intermediate receives only basic AI-powered style recommendations and has 3 attempts. The reset period (per month, per account, per salon or another cycle) is not yet defined and must be fixed in product settings before launch.

Pro usage rule

Pro includes every AI capability available in Intermediate and the complete AI Smart Styling package: all basic and advanced capabilities, including photo-assisted recommendations, visualisation and virtual try-on. The earlier decision was that Pro has all features; a fair-use/technical cost policy may still be needed. Do not remove any Intermediate AI capability from Pro.

AI catalogue — Men's collections

- Length: buzz/ultra-short, short, medium, long and growing-out.
- Classic: crew cut, Ivy League, side part, taper and French crop.
- Trend-led: textured crop, quiff, pompadour, curtains, wolf cut and modern mullet.
- Aesthetics: CEO, Old Money, Mafia-inspired, clean/minimal, rugged and celebrity-inspired.
- Texture filters: straight, wavy, curly and coily.
- Additional filters: volume, maintenance and beard compatibility.

AI catalogue — Women's collections

- Aesthetics: CEO/executive, Old Money/quiet luxury, Mafia/Femme Fatale-inspired, Korean/K-drama and glamour.
- Short: pixie, bixie, French bob, blunt bob and asymmetrical bob.
- Medium/long: lob, layers, butterfly cut, feather cut, V-cut and U-cut.
- Bangs: curtain, wispy, full, side-swept and face-framing layers.
- Styles: braids, ponytails, buns, updos, bridal, traditional and festive styles.
- Colour: black/brown, chocolate, caramel, balayage, ombre, highlights, copper, burgundy, silver and creative colours.

AI catalogue — Kids' collections

- Age-appropriate short cuts, crew/taper, textured fringe and natural curls.
- Bob, pixie, simple braids and ponytails.
- Keep the catalogue practical and guardian-aware.
- Do not market chemical colour or perm services for children as routine recommendations.

Filters and interaction flow

- Audience, length, texture, finish, maintenance time and occasion.
- Aesthetic, cut, colour, highlights, bangs and transformation.
- User chooses hairstyle, beard/grooming, general skincare education or a combination.

- Collect optional preferences: hair length/texture, maintenance level, occasion, style preference, approximate budget and user-entered goals.
- Offer 2–4 suggestions with plain-language reasons, maintenance notes and questions to ask a stylist.
- Save favourites, compare selected looks and find salons offering the relevant service.

AI capability truth

A catalogue, reference image, upload preview or static overlay is not genuine photo analysis. Photo-informed recommendations and virtual try-on require a real image-processing/AI service. Label previews as illustrative and do not guarantee that the salon result will match the generated look.

10. RATINGS, REVIEWS, SNEPR POINTS & SEPARATE CUSTOMER FEATURES

These are platform-level trust and engagement modules from the earlier product specification. They are distinct from the salon's paid queue-management tier. Their exact final inclusion and release phase should be reflected in the current entitlement matrix before implementation.

Public barber ratings and reviews

- Anyone can browse barber profiles, average rating, review count and published reviews without logging in.
- Login is required to submit a review.
- Accept a 1–5 star rating and optional written feedback after an eligible completed visit.
- Prevent duplicate reviews for the same visit.
- Mark eligible reviews as verified without exposing private booking or customer details.
- Provide report, moderation, edit and dispute policies.
- Subscription tier must not change a barber's public score or buy better public ranking/visibility.
- Review incentives must not depend on giving five stars; reward honest verified reviews equally across 1–5 stars.

Snepr Points — proposed rules

- Earlier suggested test reward: +5 points for an eligible verified completed service.
- Earlier suggested test reward: +10 points for an eligible verified review.
- These point values are proposals, not confirmed launched rewards.
- Give the same review reward for 1–5 stars.
- Maintain a ledger for earning, redemption, expiry and reversal.
- Define caps, redemption value, expiry and eligible rewards before launch.
- Withhold/reverse points for cancellations, duplicate events, self-reviews and confirmed fraud.
- Keep customer points separate from barber reputation; never reward barbers for five-star reviews.

Separate customer-facing products / add-ons — explicitly distinct

Feature	What customer sees	Relationship to queue plans
Priority Queue	An eligible customer can access a priority queue option according to transparent salon rules.	Separate feature. Not a standard plan queue entitlement.
Salon Membership	A salon offers membership packages, benefits and exclusive deals.	Separate feature/product. Not the same as queue priority.
Loyalty & Rewards	Customer earns and redeems points/rewards for visits or purchases.	Separate engagement module; distinguish from subscription plan.
Offers & Promotions	Salon publishes discounts, campaigns and special offers.	Separate customer-facing marketing feature.

Critical trust rule

Never allow a salon subscription payment to manipulate public barber ratings. Never reward a five-star review more than a one-star review. If the platform offers rewards, reward verified participation—not positive sentiment.

11. FINAL SUBSCRIPTION PLANS — LATEST AGREED STRUCTURE

The prices and entitlements below reflect the latest plan decisions in the current project discussion. This supersedes earlier draft matrices that placed QR joining only in higher plans or included AI in Entry.

ENTRY	₹199
Run your salon. Essential salon operations and queue management.	per month

Entry — salon profile and services

- Create/manage salon profile, logo, cover photos, address, contact, description, facilities and opening hours.
- Add/edit salon services and categories.
- Set service prices and estimated durations.
- Activate/deactivate services.

Entry — queue

- Manual queue entry by staff.
- QR queue joining by customers.
- Remote queue joining through Snepr.
- Automatic token generation.
- View active and waiting customers.
- Waiting In Service Completed status management.
- Cancel/remove tokens.
- Assign customer to barber/staff.
- Manually call next customer.
- View total waiting-customer count.

Entry — appointments, staff and dashboard

- Basic appointment requests, upcoming list, accept/reject and cancellation.
- Basic staff profiles, edit details, assign customers, activate/deactivate staff.
- Daily customer count, completed services, waiting count, appointments and basic daily summary.

Entry AI

No AI Smart Styling features. No basic AI recommendations, no AI photo recommendations, no visualisation and no virtual try-on.

INTERMEDIATE

₹400

per month

Give customers more control.
Customer-facing queue transparency, notifications and limited basic AI styling.

Includes every Entry feature, plus:

Intermediate — live queue experience

- Customer-facing live queue visibility.
- Queue position and number of people ahead.
- Approximate turn-time prediction with target accuracy of ±5 minutes.
- Recalculate estimates when queue position, service duration, staff availability or delays change.
- Notify customers when their turn is approaching and when ready.

Intermediate — appointments and staff

- Manage appointment availability and staff-wise availability.
- View appointments by barber.
- Prevent conflicting bookings and manage rescheduling.
- Track appointment status.
- Individual barber schedules, staff-wise queue visibility and service assignment.
- Track completed services per barber and basic individual performance.

Intermediate — customer experience, analytics and notifications

- Enhanced salon profile and complete customer-facing service menu.
- Show prices, estimated service durations, available appointment slots and queue information.
- Daily/weekly/monthly customer counts.
- Appointment statistics, queue performance and completed-versus-cancelled reports.
- Staff-wise service counts and basic revenue/service reports.
- Appointment confirmation/reminders/cancellation updates.
- Queue turn-approaching and turn-ready notifications.

Intermediate AI — exactly 3 basic attempts

- Basic AI-powered hairstyle/style recommendations only.
- 3 attempts per applicable usage period.
- No advanced AI visualisation or virtual hairstyle try-on.
- Reset period and exact definition of one attempt are open decisions.

PRO

₹449

per month

Grow smarter.
Everything in Intermediate plus complete AI Smart Styling and advanced operational intelligence.

Includes every Entry and Intermediate feature, plus:

Pro — advanced queue intelligence

- Advanced queue analytics and staff-wise queue performance.
- Service-duration analysis and peak waiting-hour insights.
- Compare estimated waiting time with actual waiting time.
- Advanced queue controls and configurable assignment rules.
- Multi-barber queue optimisation.

Pro — complete AI Smart Styling

- Every basic AI recommendation capability in Intermediate.
- No 3-attempt restriction, subject to a reasonable fair-use policy.
- Photo-based hairstyle recommendations.
- Personalised hairstyle suggestions.
- AI hairstyle visualisation.
- Virtual hairstyle try-on.
- Advanced personalised styling recommendations.
- All additional advanced AI styling capabilities released within Snepr.

Pro — business intelligence and operations

- Revenue trends and service-wise revenue breakdown.
- Staff-wise revenue and performance reports.
- Customer visit trends and peak-hour analysis.
- Appointment conversion statistics.
- Downloadable business reports.
- Advanced staff performance dashboard and staff-wise service/revenue reports.
- Detailed staff availability controls and advanced assignment rules.
- Multi-chair management.
- Multi-branch management only once implemented and subject to the final branch entitlement.

Pro — customer retention and dashboard

- Identify repeat and inactive customers.
- Customer visit-frequency reports.
- Service popularity and customer retention reports.
- Overall business performance, queue and appointment analytics, revenue overview, staff performance and customer activity.

Price gap strategy

Intermediate is ₹400/month and Pro is ₹449/month: a ₹49 difference. Pro should make the value of the full AI package and advanced analytics clear. Do not advertise multi-branch or other features until entitlement, implementation and support are ready.

11A. PLAN COMPARISON MATRIX

Feature	Entry ₹199	Intermediate ₹400	Pro ₹449
Salon profile & opening hours			
Service catalogue & pricing			
Manual queue joining			
QR queue joining			
Remote queue joining			
Automatic token generation			
Queue status management			
Barber/staff assignment			
Basic queue counts			
Customer-facing live queue visibility	—		
People-ahead / queue position	—		
Approx. turn time ±5 min target	—		
Queue turn notifications	—		
Appointment management	Basic	Advanced	Advanced
Staff management	Basic	Enhanced	Advanced
Business analytics	Basic	Standard	Advanced
AI basic recommendations	—	3 attempts	Included
Photo-based AI recommendations	—	—	Included
AI hairstyle visualisation	—	—	Included
Virtual hairstyle try-on	—	—	Included
Advanced AI styling	—	—	All features
Multi-barber optimisation	—	—	
Multi-chair management	—	—	
Customer retention insights	—	—	
Downloadable reports	—	—	
Multi-branch management	—	—	Only if finalised/implemented

Plan integrity rules

- Manual and QR queue joining and remote queue joining are included in all three plans.
- Do not move core queue joining behind a paid tier.
- Priority Queue and Salon Membership are separate customer-facing features, not a queue-plan upgrade.
- Intermediate and Pro show approximate turn time with a ±5-minute target; do not call it a guarantee.
- Pro includes everything in Intermediate, including all AI features, plus advanced functionality.
- Entry does not include AI Smart Styling.
- Intermediate receives exactly three basic AI recommendation attempts per defined usage period.
- All plan limits must be enforced by backend subscription entitlements.

12. END-TO-END OPERATING PROCEDURES

A. Salon setup and activation

Step	Owner/staff action	Snepr/system action
1. Register	Salon owner submits account and salon details.	Create owner account; mark verification status.
2. Verify	Owner confirms salon name, address, contact and authority.	Admin checks details and approves/requests correction.
3. Build profile	Owner adds hours, facilities, photos, services and prices.	Publish profile only when required fields are complete.
4. Add staff	Owner adds barbers/stylists, roles, hours and service skills.	Create staff access with least-privilege permissions.
5. Configure queue	Owner sets capacity, hours, late-arrival and cancellation rules.	Configure queue and token rules.
6. QR setup	Owner downloads/prints salon-specific QR.	QR opens correct salon profile/queue flow.
7. Test	Staff run test tokens and complete/cancel test entries.	Check state changes, notifications, customer view and audit events.
8. Go live	Owner confirms staff are trained and queue updates are assigned.	Enable public queue only when real update process is ready.

B. Customer joining by manual entry

- Customer walks into salon and asks to join the queue.
- Receptionist selects Add Customer / Manual Join action.
- Staff selects customer identifier/contact method, service and optional barber.
- System checks duplicate active token, service availability and queue capacity.
- Backend generates token and inserts queue entry.
- Customer receives/reads token and queue rules; eligible notifications can be sent with consent.
- Staff updates queue as customer is called and served.

C. Customer joining by QR

- Customer scans salon-specific QR code.
- QR opens the correct salon profile or queue join page.
- Customer reviews service menu, price, queue status/rules and selects service.
- Customer confirms joining.
- Backend validates and creates token.
- Customer sees confirmation; salon dashboard receives the new queue entry.
- QR must not bypass duplicate, capacity, open-hours or joining-policy checks.

D. Customer joining remotely

- Customer finds salon in Snepr from outside the salon.
- Customer checks salon details, service, queue availability and joining rules.
- Customer selects service and confirms Join Queue.
- Backend checks salon availability, capacity, eligibility, duplicate active token and any distance/check-in rule.
- Backend creates token and updates queue.
- Customer receives token and follows queue updates according to plan.
- Customer travels to salon and checks in if required by salon policy.

E. Staff serving a customer

- Staff sees the next eligible waiting token.
- Staff calls the customer / marks turn approaching.
- Staff starts service when customer is present.
- Staff marks service completed.
- System records timestamps and updates queue for customer and salon.
- Next customer is called according to queue rules and barber assignment.

12A. EXCEPTION HANDLING & DAILY SOP

Customer late / no-show

- Show arrival and grace-period rule before joining.
- Staff marks No-show only after stated grace period and posted policy.
- Queue advances to next eligible customer.
- Customer sees clear status; no hidden penalties.

Customer cancellation

- Customer can cancel while token is in a cancellable state.
- System records time/reason where collected.
- Queue order and ETA are recalculated.
- Salon sees cancellation.

Salon pauses queue

- Owner pauses new joins due to overload, staff break or closing preparation.
- Existing tokens remain visible and are not silently deleted.
- New customers see joining is paused and, if available, reason/reopening time.
- On resume, system reopens joining and updates estimates.

Stale queue data

- System stores last-updated time.
- If staff updates stop beyond a defined threshold, show stale status.
- Hide or downgrade ETA if data is too old.
- Notify salon staff or show operational reminder.
- Do not display LIVE badge when data is not live.

Duplicate or fraudulent entries

- Use an idempotent join-confirm endpoint.
- Rate-limit repeated join requests.
- Consider phone verification where proportionate.
- Set one active token per customer per salon unless deliberate exception is configured.
- Audit admin overrides and suspicious behaviour.

Closing time

- Stop new joins before closing according to salon setting.
- Keep existing tokens and communicate whether salon can finish them.
- Do not issue remote joins that cannot reasonably be served before close.
- Define end-of-day handling and customer notification.

Network / service outage

- Display when queue cannot be refreshed.
- Do not claim live status or fresh ETA while disconnected.
- Define safe manual fallback and reconciliation after service returns.
- Log failed actions to avoid silent token duplication or status loss.

13. TECHNICAL ARCHITECTURE & CURRENT PROTOTYPE STATUS

The project materials define product components and include customer-app HTML prototypes. They do not establish a verified final production backend/framework/database stack. This report separates confirmed prototype evidence from recommended production architecture.

Prototype evidence

- Customer app prototype files exist as HTML artefacts, including a refined/liquid UI version.
- Prototype navigation contains Explore, My Queue, AI Studio and Profile.
- Prototype uses Leaflet, OpenStreetMap tiles, browser geolocation with permission, OSRM routing and Nominatim geocoding/search in manual-origin flow.
- Prototype includes demo salon cards and sample queue values; some screens label information DEMO PREVIEW / DEMO DATA.
- AI Studio includes reference catalogue and upload controls, but personalised preview generation is not connected.
- Prototype is not evidence of live backend, real queue data, real salon partners or working AI image analysis.

Recommended logical production components

Component	Responsibility
Customer web/mobile experience	Discovery, salon profile, service menu, queue join/status, appointments, AI Studio and profile.
Salon owner/staff dashboard	Profile/service management, queue control, appointments, staff, analytics and settings.
Admin console	Salon verification, support, subscription oversight, moderation and audited overrides.
Authentication & roles	Customer, owner, manager, receptionist, barber/stylist and admin permissions.
Salon catalogue service	Salon profiles, branches, locations, hours, facilities, services, prices and durations.
Queue/token service	Unique tokens, queue ordering, status transitions, duplicate prevention, pause/capacity and audit log.
Appointment service	Time slots, staff availability, conflict prevention, rescheduling and status.
Subscription entitlement service	Plan purchase, active tier, feature gates, quotas, billing/webhook state.
AI provider adapter	Recommendation and image processing, quotas, provider errors and safe image handling.
Review service	Completed-visit eligibility, reviews, moderation, reporting and public display.
Points ledger	Earning, redemption, expiry, reversal and fraud checks.
Notification service	In-app/push first; SMS/WhatsApp/email after provider setup and consent.
Analytics/reporting	Queue freshness, wait time, service durations, usage, staff performance and revenue when supported.
Infrastructure/operations	Monitoring, backups, rate limits, abuse detection, audit logs and incident response.

Suggested data entities — architecture blueprint

- Salon; Branch; SalonHours; SalonFacility; ServiceCategory; Service; Staff/Barber; Chair/Station.
- Customer; CustomerConsent; CustomerPreference; CustomerFavourite.
- QueueEntry/Token; QueueEvent; QueuePolicy; QueueCapacity; QueueEstimate.
- Appointment; AppointmentSlot; StaffAvailability.
- Subscription; Plan; Entitlement; UsageCounter; PaymentEvent.
- Review; ReviewReport; ModerationAction.
- PointsAccount; PointsLedgerEntry; Redemption.
- AIRequest; AIUsage; ImageProcessingJob; ImageRetentionRecord.
- Notification; NotificationDelivery; AuditLog.

Backend rules that matter

- All queue tokens and state transitions are server-authoritative.
- Enforce plan entitlements and AI attempt quotas on backend.

- Use role-based authorization on sensitive operations.
- Use audit logs for staff actions, reward changes and admin overrides.
- Store secrets in backend environment/secret manager, never public HTML.
- Use backups, monitoring, rate limits and abuse detection.
- Test security rules and access control alongside features.

14. MAPS, LOCATION, GPS & ROUTE EXPERIENCE

The customer prototype includes salon discovery by locality, location permission, a map, route calculation and manual landmark/address starting point. Browsing a map and showing a live moving location are different capabilities.

Current prototype approach

- Leaflet map display and OpenStreetMap tiles.
- Browser geolocation API to request current location with permission.
- OSRM routing endpoint for route geometry, distance and estimated travel time.
- Nominatim geocoding for manually entered starting landmark/address.
- Route mode selector: driving, two-wheeler/cycling and walking.
- Map browsing and manual area selection can work without showing live user position; exact route from user needs selected origin or location permission.

GPS-off use case

If a customer does not switch on GPS or denies location permission, Snepr can still allow manual area selection, salon search, map browsing, selecting a landmark/address as the starting point and calculating a route from that chosen origin. It cannot truthfully show the customer's exact live moving position without an authorized location source. Any alternative location source must be explicitly available, permitted by the device/platform and accurate enough; do not silently infer or claim precise GPS-equivalent tracking.

Customer journey

- Choose area or search salon/service.
- Open map and view salon pins.
- Open salon profile and join queue/book.
- On queue screen, choose current location or enter starting landmark/address manually.
- Choose travel mode and calculate route.
- Refresh route when needed.
- Show clear status if location permission is denied or route service is unavailable.

Production cautions

- Confirm terms, attribution and rate limits for map/geocoding/routing providers.
- Do not hard-code API keys or expose secrets.
- Do not imply live traffic or turn-by-turn navigation unless provider supports it.
- Validate salon coordinates and exact address before showing distance.
- Offer manual-origin fallback and accessible permission explanation.
- Respect user consent and do not request precise location unless it improves the selected feature.

15. SALON ONBOARDING, TRAINING & SUPPORT

Snepr has a two-sided launch: customers need participating salons, and salons need customers. Social content alone is not enough; direct owner/manager outreach and hands-on onboarding are required.

Salon acquisition and onboarding flow

- Research local salons by micro-market and build a verified prospect list.
- Contact owner/manager with a concise founder introduction.
- Ask about current walk-in queue process, peak hours, wait complaints and who updates queue status.
- Show the real owner workflow, not only a marketing presentation.
- Agree who is responsible for adding/confirming manual walk-ins and updating queue status.
- Verify salon name, contact, address, services, prices, hours, staff and photos.
- Get permission to publish salon details, logo, interior photos and identifiable staff/customer content.
- Configure services, durations, staff, queue capacity, joining rules and QR code.
- Train owner/receptionist/barbers on call-next, start, complete, cancel/no-show and pause/resume.
- Run test tokens; verify customer and salon views are consistent.
- Go public only after salon can keep queue information accurate.

Suggested owner interview questions

- How do you currently manage walk-ins and the order of customers?
- When are your busiest hours and how often do customers complain about waiting?
- Who updates a token as completed, and how quickly can they do it during a busy period?
- What happens when a customer leaves, arrives late or does not respond when called?
- Would customers join remotely before arriving, or should remote joining be restricted by QR or arrival rules?
- Which is most valuable: queue tracking, notifications, service menu, customer history or daily reports?
- What monthly amount would you pay after a 30-day pilot: ₹299, ₹499, ₹799 or none—and why? This is an earlier research question; test latest prices separately.
- What would make you stop using the product?

Support workflow

- Publish one monitored salon-owner support channel.
- Record issue type, salon, affected token/appointment, time and resolution.
- Escalate queue data errors immediately.
- Have a launch-day escalation contact for each salon.
- Do not leave customer questions unanswered if the app promises a notification or queue status.

16. BHUBANESWAR MARKET ENTRY & SALON PROSPECT RESEARCH

Research snapshot: 29 October 2026. Area rankings are qualitative go-to-market hypotheses based on visible salon listings, catchment and proximity—not verified rankings of footfall, queue congestion, willingness to pay or actual software need. Every salon below is a prospect from public-listing research, not a confirmed Snepr partner. Re-verify contact, owner, address, hours, services and interest before outreach.

Area priority and launch waves

Rank	Area cluster	Rationale
1	Patia–KIIT Road–Infocity	Best initial pilot zone; student/young professional catchment and dense unisex/premium salon cluster. Start with a 1–2 km micro-cluster.
2	Jayadev Vihar–Mayfair–Biju Patnaik College Road	Second zone; premium/full-service salons and mall/hotel/office proximity.
3	Saheed Nagar–Maharishi College Road–Bhawani Mall	Established chains and local salons; test queue management and analytics.
4	Chandrasekharpur–Niladri Vihar–Sailashree Vihar	Residential/family and repeat-grooming use cases.
5	Nayapalli–IRC Village	Mixed service salons; service menus and appointment-adjacent workflows.
6	Khandagiri–Jagamara–Kolathia	Later southern expansion after first workflow proves repeatable.

Recommended sequence

- Wave 1: Patia–KIIT Road–Infocity, 1–2 km micro-cluster.
- Wave 2: Jayadev Vihar–Mayfair–Biju Patnaik College Road.
- Wave 3: Saheed Nagar–Maharishi College Road–Bhawani Mall.
- Wave 4: Chandrasekharpur/Sailashree Vihar and Nayapalli/IRC Village.
- Wave 5: Khandagiri/Jagamara/Kolathia after onboarding and sales motion are repeatable.

Salon prospect list — historical public-listing snapshot

Area	Prospect	Address snapshot	Phone	Listing signal	Priority
Patia	Green Trends Unisex Salon	D1 Square, Nandankanan Road, above Utkal Hyundai	+91 98610 77886	4.7/5; 5,063	High

17. BUSINESS MODEL, PRICING LOGIC & UNIT ECONOMICS

Core business model: salon-facing SaaS subscriptions, with the customer app as discovery, queue and engagement channel. Additional monetisation may later come from distinct customer-facing add-ons, but should not compromise trust in the core queue experience.

Latest working monthly prices

Plan	Price	Position
Entry	₹199	Essential salon operation and queue management.
Intermediate	₹400	Customer-facing live queue, turn estimate, notifications and 3 basic AI attempts.
Pro	₹449	Complete AI styling and advanced business/queue intelligence.

Earlier cost reference

A prior planning note recorded approximate fixed costs of ₹5,000/month. Refresh it against current hosting, domain, payment, AI, notification and support expenses.

Illustrative gross fixed-cost coverage at latest prices

Plan	Price/salon/month	Salons to reach ₹5,000 gross	Gross revenue at that count
Entry	₹199	26	₹5,174
Intermediate	₹400	13	₹5,200
Pro	₹449	12	₹5,388

These are arithmetic illustrations only. They do not represent profit or true break-even. They exclude taxes, payment gateway fees, AI usage, SMS/WhatsApp costs, support, acquisition, travel, refunds, discounts, churn, development, equipment and founder compensation.

Earlier price hypotheses — superseded

The 29 October market report tested ₹299 / ₹499 / ₹999+ as hypotheses, and suggested 11 salons at ₹499 to cover ₹5,000 gross fixed cost. That was an earlier pricing experiment, not the latest plan decision. Current working prices are ₹199 / ₹400 / ₹449.

Potential additional revenue modules

- Priority Queue as a separately priced/configured option.
- Salon Membership packages and benefits.
- Loyalty/rewards with clear ledger and redemption economics.
- Offers/promotions with consent and messaging cost controls.
- Multi-branch add-on or branch-based pricing after implementation.

Commercial terms still open

- GST inclusive/exclusive public price.
- Monthly/annual billing and discounts.
- Trial period, cancellation, refund, renewal and failed-payment rules.
- Staff seats and branch limits.
- Monthly booking/queue volume limits.
- AI attempt reset period and fair-use limits.
- Notification channel quota and overage.
- Support response expectations by plan.

18. MARKETING STRATEGY & PRE-LAUNCH CAMPAIGN

Campaign: THE WAITING GAME. Platform: QUESTION EVERYTHING. Period: 3 November–5 December 2026. Launch target: 5 December 2026 (proposed). Geography: Bhubaneswar first. Audience: salon customers and salon owners.

Core creative idea

Everyone is waiting for something. Some wait in queues; others wait for opportunities, recognition or their moment. Snepr first earns attention through that shared emotion, then reveals a practical salon experience built around time and queue visibility. Make people feel understood before explaining the product. Mystery should create curiosity, not lasting confusion.

Five campaign phases

Dates	Phase	Purpose
3–9 Nov	Confusion / emotion-led mystery	No direct app explanation. Desired response: "That feels like my life. Who is behind this?"
10–16 Nov	Curiosity + reveal	Build speculation; planned brand reveal 12 Nov.
17–23 Nov	Product understanding	Explain customer and salon-owner value.
24–30 Nov	Trust + intent	Show real product, gather interest, recruit launch salons.
1–5 Dec	Countdown + launch	Convert attention into real sign-ups, installs, enquiries or bookings that are supported.

Audience-specific positioning

Audience	Message	CTA
Customers	Know the queue before you go. Make your time count.	Follow, join launch updates, try real product when available.
Salon owners	Help customers understand the wait; give your salon a clearer digital presence.	Request demo, verify details and onboard.

Daily calendar — 3 to 16 November

Date	Format	Hook / content
3 Nov	Reel 1	"You wait. You wait some more. But why?" Clock, restless feet, slow queue; no salon/app reveal.
4 Nov	Stories poll	"What tests your patience most?" Queues / late people / uncertainty / waiting for an opportunity.
5 Nov	Poster 1	"Your turn will come. They said." Ivory, espresso typography, negative space.
6 Nov	Reel 2	"The hardest part isn't waiting. It's not knowing how long."
7 Nov	Stories	"What's the longest you've waited for something?" Re-share only with permission.
8 Nov	Carousel	"5 types of waiting everyone understands." Friend late, appointment, result, opportunity, your moment.
9 Nov	Reel 3	"Some queues don't have a number. Just patience."
10 Nov	Poster 2	"How much of your life have you spent waiting?"
11 Nov	Stories	"What do you think we're building?" Poll + question sticker.
12 Nov	Brand reveal Reel	"You've waited long enough. Meet Snepr." Scissors/hair transition into official wordmark.
13 Nov	Founder post	"We started with one question: why should your time be wasted because you don't know the queue?"
14 Nov	Problem Reel	"You had plans. The queue had other plans." End: "Your time matters."
15 Nov	Stories	"Time should be yours." Behind brand.
16 Nov	Carousel	"What if you knew before you went?" Introduce queue visibility and salon discovery.

18A. DAILY CALENDAR — 17 NOVEMBER TO 5 DECEMBER

Date	Format	Hook / content
17 Nov	Customer Reel	“A haircut shouldn't take your entire afternoon.”
18 Nov	Research Stories	“Would you check the queue before leaving home?” Ask what makes information trustworthy.
19 Nov	Product carousel	“Know the Queue Before You Go.” Discover check available queue info decide/join.
20 Nov	Product preview Reel	“Imagine knowing before you reach the salon.” Use real product or label mock screens.
21 Nov	Community post	“What would you do with one extra hour every week?” No guaranteed savings claim.
22 Nov	FAQ Stories	“What is Snepr, and who is it for?” Distinguish live from planned.
23 Nov	Founder Reel	“A better salon visit should work for customers and salon owners.”
24 Nov	Experience Reel	“POV: you stop guessing how long you'll wait.” Show real workflow.
25 Nov	Salon-owner Stories	“Own a salon in Bhubaneswar?” Invite demo/onboarding enquiries.
26 Nov	Customer carousel	“3 things to check before choosing a salon.”
27 Nov	Brand Reel	“Your time is valuable. Your salon experience should respect it.”
28 Nov	Early-access post	“Want to be among the first to try Snepr?” Only with real sign-up and follow-up.
29 Nov	Build-in-public Stories	“Getting ready for Bhubaneswar.” Real testing and onboarding progress.
30 Nov	Teaser Reel	“December. A different way to experience your salon visit.” Say planned until ready.
1 Dec	Countdown Reel	“The waiting game is about to change.”
2 Dec	Launch FAQ Stories	“Here's how to get started.”
3 Dec	Product demo Reel	“See how Snepr works.” Real customer and owner journeys.
4 Dec	Countdown post	“Tomorrow, meet Snepr.”
5 Dec	Launch day	“Meet Snepr. Your Time. Your Style. Your Snepr.”

Launch date is conditional

5 December 2026 is a proposed target, not an unconditional promise. Move the date if salon onboarding, queue data, customer destination, privacy, support or core flows are not ready.

19. DAY 1 REEL — FINAL HINGLISH CREATIVE

Campaign: The Waiting Game • Duration target: 50–53 seconds • Format: vertical 9:16 • Export: 1080 × 1920.

Cover hook

“WAQT TUMHARA HAI. PHIR WAIT KYUN?”

Campaign intent

Make Snepr feel like a mindset before it feels like an app. The first reel should be globally relatable, emotionally sharp, visually premium and easy to share. Do not reveal the full product or explain salon booking yet.

Timed storyboard

Time	Visual / edit	Voiceover / on-screen text	Sound
0–5	Close-up of premium watch/clock; warm side light; slow camera move.	Waqt tumhara hai...	Soft ticking; low cinematic ambience.
5–11	Person gets ready to leave; pauses at door and checks time.	Phir bhi...	Ticking continues; music builds.
11–18	Tapping foot, glancing forward, queue moving slowly.	Har baar wait kyun?	Subtle pulse; no comic frustration.
18–26	Montage: waiting for reply, elevator indicator, clock hand.	Hum kitna waqt... bas wait karte hue guzaar dete hain?	Music opens; short pauses.
26–34	Stillness; person looks up, breathes and steps forward.	Har wait galat nahi hota.	Ticking fades; warm note.
34–42	Warm ivory frame; espresso typography appears.	But your time has value. Some things deserve your time.	Soft resolution.
42–49	Minimal ivory screen; tiny bronze S mark.	Not everything deserves your wait.	Brief silence, soft finish.
49–53	Small refined end card.	SOMETHING IS CHANGING. — SNEPR	No loud logo sting.

Ready-to-post caption

Waqt tumhara hai. Phir wait kyun?

Life mein hum sab kisi na kisi cheez ka wait kar rahe hain.
The right opportunity. The right moment. The right people. Ya bas apni baari aane ka.

Par ek baat socho...
Har cheez ka wait karna zaroori hai kya?

Some things deserve your time.
Not everything deserves your wait.

A thought worth sitting with.
What are you done waiting for?

#TheWaitingGame #QuestionEverything #YourTimeMatters

Stories and community

- Story 1: “Ek honest question... Kitna time hum un cheezon ka wait karte hain jo shayad worth it hi nahi hoti?”
- Story 2 sticker: “What’s one thing you’re tired of waiting for?”
- Optional Story 3: “Some of you will understand this differently.”
- Optional follow-up: “Har cheez ka wait karna maturity nahi hoti. Kabhi-kabhi apne waqt ki value samajhna bhi zaroori hai.” — S.

Direction and publishing

- Palette warm ivory, espresso and restrained bronze; no neon.
- Elegant serif for emotional headline; clean sans-serif for supporting text.
- Close-ups, slow push-ins, deliberate framing and shallow depth of field.
- Hard cuts, fades and intentional silence; no flashy templates or random zooms.
- Neutral, timeless and uncluttered wardrobe/locations.
- Day 1 uses tiny S mark only; no app screens, salon names, pricing or booking claims.
- Licensed/platform-cleared music; voice/text readable.
- Export 9:16 at 1080×1920; check safe margins and subtitles.
- Publish Reel then Story 1 and question sticker; reply humanly.
- After 24 hours record reach, watch time, completion/retention, shares, saves, profile visits and follows.

Creative north star

“Make people feel seen before asking them to know the brand.”

20. SNEPR ORIGINALS — THE LAST 10 MINUTES, SEASON 01

A connected romantic drama about love, everyday distractions, missed moments and the value of time. Seven connected vertical episodes, each planned above 60 seconds, with target runtimes of approximately 75–95 seconds.

Characters and continuity

- Aanya: thoughtful, witty, independent and observant; values presence more than grand gestures.
- Kabir: warm, ambitious and caring, but often distracted by work and pressure to build a better future.
- Episode 2 is a flashback; the other episodes continue the main story in order.
- Same actors and recurring props: café, bus stop, two coffees, phone and notebook page.
- End each episode with next-episode title card.
- First six episodes are story-first; finale reveals Snepr's philosophy without hard-selling.

Ep.	Title	Story and key beats	Target
01	The Last 10 Minutes	Rainy café; Aanya waits with two coffees; Kabir arrives late. They share a moment and Aanya asks "Agar humare paas sirf 10 minutes hote... toh kya karte?" Kabir says he would remind her of their first meeting. Cliffhanger: bus stop and dropped notebook.	75–85s
02	Before We Met	Flashback to rainy bus stop. Aanya drops notebook; Kabir helps collect pages. One reads "Someday, I'll stop rushing and actually see the world." They miss a bus and begin talking. Back in café, their story began with a conversation.	75–90s
03	Little Things	Small gestures: dessert, voice note, umbrella, burnt toast. Kabir remembers her tea order and puts phone down. He promises they will make time. His phone shows urgent review moved to tomorrow.	75–90s
04	Five More Minutes	Work takes over; plans postponed. Aanya waits outside bookstore. Kabir says "Bas five more minutes"; Aanya says his five minutes are never five minutes. Her voice note is deferred; she does not answer his night call.	75–90s
05	The Unsaid Things	At café, Aanya says she needs present time, not perfect time. Kabir admits he is working for a better future while they miss the present. He reveals a relocation offer with next-day deadline.	75–90s
06	If Not Now, When?	Aanya says she does not want to stop his opportunity but they keep postponing important conversations. They agree to meet without phones. At the original bus stop, Kabir brings the notebook page; Aanya says "Is baar jaldi nahi hai."	75–90s
07	The Time We Have	They discuss relocation and both ambitions honestly. Kabir says he would put his phone away, listen and not waste a minute. Montage of ordinary life. Finale text: "TIME IS ALL WE HAVE. HOW WE SPEND IT MATTERS." Snepr wordmark/tagline appears.	80–95s

Key dialogue / lines

- "Agar humare paas sirf 10 minutes hote... toh kya karte?"
- Notebook: "Someday, I'll stop rushing and actually see the world."
- "Kuch cheezein yaad rakhne ke liye repeat nahi karni padti."
- "Tumhare five minutes kabhi five minutes hote hi nahi."
- "Mujhe perfect time nahi chahiye. Bas thoda sa present time chahiye."
- "Mujhe sach se problem nahi hai. Mujhe us wait se problem hai jisme mujhe pata hi nahi tha ki main wait kar rahi hoon."
- "Problem yeh hai ki hum har important baat ko kal pe chhod dete hain."
- "Main phone side mein rakhta. Tumhari baat sunta. Aur ek bhi minute ko bas nikalne nahi deta."

Finale reveal

"TIME IS ALL WE HAVE."
"HOW WE SPEND IT MATTERS."
"YOUR TIME. YOUR STYLE. YOUR SNEPR."

Production and release rules

- Warm cinematic lighting, natural skin tones, subtle espresso/bronze/ivory accents.
- Intimate, believable performances; avoid exaggerated acting and overly dramatic music.
- Record clean dialogue and readable subtitles throughout.

• Use licensed/platform-cleared music; build a recurring motif.
• Leave a beat before cliffhangers; do not speed dialogue to fit runtime.
• Cover: SNEPR ORIGINALS / THE LAST 10 MINUTES / EPISODE [NUMBER] — [TITLE].
• Caption template: “A story about the moments we almost miss. Episode [number] is here.”
• Pinned comment asks a question linked to cliffhanger; Stories invite predictions.
• Time every rough cut; do not pad with empty footage.
• Only show product features genuinely available and working at publication.

21. SOCIAL MEDIA PRODUCTION & PUBLISHING OPERATIONS

The social playbook defines a repeatable production workflow. AI tools can help with strategy, writing, storyboards, prompts, motion specs, captions and analytics interpretation, but a human remains responsible for facts, permissions and final publishing approval.

Content pillars

Pillar	Purpose	Example
Customer problem	Make waiting and uncertainty relatable.	“Ever reached a salon and found a long wait?”
Product education	Explain how Snepr works.	Simple walkthrough using real available screens.
Salon-owner value	Start owner conversations.	“Give customers more clarity before they visit.”
Brand & lifestyle	Build emotional recall.	Cinematic scissors/hair-to-wordmark reveal.
Trust & transparency	Set honest expectations.	Explain queue visibility and what is live.

Starter weekly cadence

- Monday: customer pain-point Reel for reach and shares.
- Wednesday: product/demo explainer for profile visits and clicks.
- Friday: salon-owner Reel or carousel for qualified owner enquiries.
- Stories 2–4 days each week: polls, questions and behind-the-scenes.

Production workflow

- Clarify goal, audience, platform, length and CTA.
- Develop three concepts and recommend one.
- Write a strong first-two-second hook.
- Create timed shot list, voice-over, on-screen text, transitions and sound plan.
- Prepare caption, CTA, cover text and platform-specific versions.
- Create assets/code where supported; state if concept, browser animation, rendered video or final MP4.
- Review contrast, mobile readability, safe areas, pacing, spelling, claims and brand consistency.
- Prepare approval checklist and record approved version.

Content source-of-truth folder

Folder	Contents
01 Brand	Logo variations, colours, fonts, tone, approved tagline.
02 Product truth	Live, beta and planned features; limitations and approved claims.
03 Assets	Licensed footage, photos, screenshots, sound licences and releases.
04 Scripts	Approved scripts, shot lists, captions and briefs.
05 Exports	Final MP4s, covers, subtitles and platform-ready copy.
06 Analytics	Weekly metric exports, experiments and learnings.

Publishing guardrails

- Never invent users, salon partners, testimonials, wait-time reductions, bookings, revenue or performance results.
- Never show queue as live unless real data is connected and accurate.
- Label mock screens Product Preview or Illustrative UI.
- Do not use customer faces, private messages or salon footage without permission.
- Use licensed music/assets; do not copy another creator shot-for-shot.
- Never expose API keys, login codes or private customer information.
- Do not publish without final human approval.
- Scheduler access and automation require separate supported integration and permissions.

20-second cinematic brand reveal concept

- 0–3 sec: warm ivory canvas; metallic scissors and chestnut hair enter.
- 3–7 sec: scissors close; hair sweeps across frame and becomes a moving line; text “Your time matters.”
- 7–12 sec: line curves and settles into Snepr wordmark reveal.
- 12–16 sec: logo holds; tagline “Your Time. Your Style. Your Snepr.”
- 16–20 sec: final card and CTA “Discover Snepr.”
- Use actual approved logo asset, not a distorted recreation.

Daily / weekly / monthly routine

- Monday (30–45 min): review metrics, choose weekly objective, generate concepts and lock brief.
- Production block: create script/storyboard, collect approved assets, build/edit Reel.
- Before posting: watch export, verify claims, check caption/CTA, get approval and schedule.
- After posting: confirm live status and respond thoughtfully.
- Weekly: record results, compare posts and choose two experiments.
- Monthly: update product facts, remove outdated claims, refresh pillars and review permissions.

22. ROLLOUT ROADMAP, TESTING & LAUNCH EXECUTION

Earlier product planning recommends shipping the smallest reliable queue product first, then adding monetisation, AI and growth tools in controlled phases. The latest subscription packaging can define future plan entitlements, but no unbuilt feature should be advertised as already available.

90-day implementation and validation sequence

Period	Workstream	Deliverables
Weeks 1–2	Workflow hardening	Unique tokens, duplicate prevention, ordering, cancellation/no-show, owner transitions, pause/resume, stale timestamp and event logs.
Weeks 3–4	Pilot-ready UX	Customer token screen, owner dashboard, service menu, salon QR, notification preview, onboarding checklist and staff training.
Weeks 5–8	Pilot	3–5 salons in compact Patia/KIIT cluster; observe peak/off-peak operations and status accuracy.
Weeks 9–12	Convert/refine	Convert pilots to paid plans, test pricing, introduce reports and prioritise measured pain points.

Four rollout phases

- Phase 1 — Trust and reliable queues: Discovery, profiles, menus, public ratings, automatic tokens, live status, basic owner controls, verified-review eligibility/moderation and pilot.
- Phase 2 — Plans and points: Backend entitlements and billing; points ledger, caps, reversals and redemption; Intermediate analytics, QR join and review workflows.
- Phase 3 — AI Studio: Curated catalogue, filters, saved looks and preference recommendations; photo try-on only after privacy review, provider evaluation and cost testing.
- Phase 4 — Growth tools: Staff/chair scheduling, appointments, advanced reports, campaigns, loyalty and multi-branch after demand and reliability validation.

Pilot targets

- 3–5 salons in one micro-market with a named owner/staff champion.
- At least 80% of queue entries have correct final status during observed periods.
- Measure queue freshness and owner update latency daily.
- Measure customer join completion, duplicate/abandoned join and notification outcomes.
- At least 3 of 5 pilot salons express willingness to pay after trial; otherwise revisit value proposition/pricing.
- Track weekly active salons, joins per salon, repeat usage, churn/retention and paid conversion.

Launch readiness gates

- Product core flows tested end-to-end.
- Participating salons verified and trained.
- Queue update responsibility assigned per salon.
- Customer destination/app/site link tested.
- Privacy policy, terms and data disclosures match actual services and SDKs.
- Support and launch-day escalation contacts ready.
- Pricing, plan entitlements and billing terms approved.
- Only available features shown in demos and public communication.
- Move launch date if any trust-critical gate is not ready.

23. PRIVACY, SECURITY, TRUST & RESPONSIBLE AI

Customer data and privacy

- Collect only necessary data for selected service.
- Explain why phone number, account detail or photo is requested.
- Provide deletion path for personal data and uploaded photos.
- Restrict access to customer photos, queue history and account data.
- Do not expose phone numbers or private booking details on public profiles.
- Obtain consent before photo processing and disclose processing, retention and third-party use.
- Do not use customer photos for model training without explicit permission.
- Use encryption in transit/at rest where applicable and secure retention controls.

Reviews and reputation

- Only allow verified review after eligible completed visit.
- Prevent duplicate review submissions for the same visit.
- Moderate abuse and provide report/edit/dispute handling.
- Do not let subscription tiers buy higher scores or public ranking.
- Do not reward positive ratings; reward verified participation equally.

AI safety

- AI hairstyle suggestions are inspiration, not guaranteed outcomes.
- Photo-based analysis requires real AI integration and explicit consent.
- Do not infer identity from a photo.
- Do not claim exact facial measurements unless validated.
- Do not diagnose skin conditions or prescribe treatments.
- General skincare guidance should be non-diagnostic and direct persistent/concerning symptoms to a dermatologist.
- Use secure image processing, limited retention, deletion controls and label generated previews.

Security and platform operations

- Enforce plan gates and role permissions on backend.
- Use rate limits, abuse detection, backups, monitoring and audit logs.
- Keep secrets in backend environment/secret manager, never public HTML.
- Log staff queue actions, reward changes and admin overrides.
- Use least-privilege access and test security rules automatically.
- Prepare accurate app-store privacy/data-safety disclosures for actual SDKs and services.

Notifications and integrations

- Queue confirmations, status updates, salon join alerts and review alerts are product events.
- Integrate SMS/WhatsApp/email only after provider setup.
- Define monthly usage, overage, consent, opt-out and delivery-failure handling.
- Begin with in-app/push where feasible to control variable costs.
- Do not promise WhatsApp/SMS notifications until provider and consent requirements are ready.

24. SUCCESS METRICS, RISKS & MITIGATIONS

Operational metrics

Metric	What it tells Snepr	How to use it
Queue freshness	How recently salon staff updated state.	Flag stale salons; suppress unreliable ETA.
Invalid state transitions	How often statuses move incorrectly.	Improve UI, permissions and training.
Duplicate-token rate	Whether repeated joins create duplicates.	Test idempotency and abuse controls.
Active salons	Salons operating in a period.	Measure supply-side activation.
Queue joins per salon	Customer usage per salon.	Understand adoption and value.
Join completion / abandonment	Where customers leave join flow.	Improve onboarding/friction.
Wait estimate error	Predicted vs actual turn time.	Tune estimate and avoid overpromise.
Notification delivery	Whether turn alerts send and deliver.	Monitor reliability and cost.
Verified review share	Reviews linked to eligible visits.	Track trust and fraud.
Review report/moderation time	Quality and moderation workload.	Improve safety process.
Repeat visit rate	Whether customers return.	Assess loyalty and salon value.
Points redeemed / abuse	Reward economics and misuse.	Set caps and reverse fraud.
AI success/failure and cost	Cost per successful result.	Set quotas/provider controls.
Paid conversion / plan mix	Plan adoption.	Validate packaging and pricing.
Churn / gross margin / support load	Business sustainability.	Adjust pricing, limits and operations.

Risks and mitigation

Risk	Mitigation
Stale queues	Show last-updated time, alert owner, pause/label estimates when stale.
Duplicate/fraudulent joins	Idempotent endpoint, rate limits, one-active-token policy and optional verification.
Remote join abuse/no-show	Transparent arrival/check-in rules, token expiry and grace period.
Staff do not update status	Simple actions, training, assigned owner, reminders and latency measurement.
Feature overload	Ship core queue first; modularise advanced features.
AI cost overrun	Attempt quotas, rate limits, fair-use policy and provider cost monitoring.
Fake reviews	Completed-visit eligibility, duplicate prevention and moderation.
Points abuse	Caps, ledger, reversals and fraud checks.
Notification costs	Start in-app/push; meter SMS/WhatsApp before bundling.
Unreliable ETA	Actual durations, multi-staff model, uncertainty range and stale suppression.
Pricing/margin risk	Interview owners, track variable cost and revise quotas.
Unverified salon details	Verify owner, contact, hours, menu and permission.
Misleading marketing	Approved facts, mockup labels, no invented metrics or partnerships.

25. OPEN DECISIONS & MASTER EXECUTION CHECKLIST

These items must be resolved so product, pricing, marketing and salon operations stay consistent.

Queue and operations

- Remote queue distance/geofence rule, check-in requirement, arrival grace period and token expiry.
- Queue capacity, pause/resume and closing-time behaviour.
- Late arrival/no-show grace period and penalties, if any.
- One active token per customer per salon or multiple active tokens.
- Exact status names and who can update each.
- Manual entry identity/contact requirements.
- Queue handling during staff breaks and multi-barber operations.
- Stale-data threshold and customer-facing fallback.
- How ±5-minute target is measured and when ETA is suppressed.

Plans and billing

- GST inclusive/exclusive pricing; monthly/annual billing and discounts.
- Trial period, cancellation, refund, renewal and failed-payment rules.
- Intermediate 3 AI attempts: reset period and what counts as one attempt.
- Pro AI fair-use policy and image-generation quota.
- Staff seats, branches, appointments, queue volume and notification limits.
- Whether Pro multi-branch is included at ₹449 or priced separately.
- Support service levels by plan.
- Which review, points and retention modules are platform-wide vs salon-plan entitlements.

AI and customer features

- Exact AI provider and photo storage/retention policy.
- Whether Intermediate basic recommendations are preference-only; current plan says basic recommendations only.
- Pro visualisation and virtual try-on output types and limits.
- Salon Membership rules, renewal, benefits and cancellation.
- Priority Queue eligibility, fairness, disclosure and salon control.
- Snepr Points earning/redemption, expiry, caps and fraud policy.
- Review moderation and dispute process.

Technology and integrations

- Final production frontend/backend/database/hosting stack is not confirmed in reviewed materials.
- Queue API and realtime/event delivery mechanism.
- Payment gateway, subscription webhook and invoice/tax workflow.
- Push/SMS/WhatsApp/email provider and per-message cost.
- Map/geocoding/routing provider terms and usage limits.
- Monitoring, backups, support dashboard and admin access controls.

Launch and sales

- Confirm actual launch date; 5 December 2026 was proposed.
- Select first 3–5 pilot salons and secure participation consent.
- Assign one owner/staff queue champion per salon.
- Verify salon details and real service-duration data.
- Prepare demo script, onboarding checklist, QR print assets and support escalation.
- Create monitored early-access path before promoting it.
- Review marketing for actual feature availability and logo accuracy.

Final readiness checklist

Workstream	Definition of ready
Brand	Approved rounded wordmark, three-bar bronze E, logo variants, colours and tagline.
Customer app	Discovery, salon details, queue join, token/status, notifications and support tested.
Salon dashboard	Roles, queue transitions, pause/resume, service durations and audit trail tested.
Queue trust	Real data, last-updated timestamp, duplicate prevention, cancellation/no-show policy and ETA suppression.
AI Studio	Entry disabled; Intermediate 3 basic attempts; Pro complete package; photo consent and costs tested.
Plans	Backend entitlements, price, quotas, billing and cancellation terms confirmed.
Salons	Verified pilot salons, trained staff, queue responsibility and listing permissions.
Marketing	Exact hooks, real product footage, mockup labels, CTA and approval recorded.
Support	Monitored contact, escalation owner, FAQs and incident process.
Launch	Only verified salons and working features publicly represented.

APPENDIX A. GLOSSARY — PLAIN ENGLISH

Term	Meaning
Queue	Ordered list of customers waiting to be served.
Token	Unique number/identifier given to a queue entry.
Manual join	Salon staff adds a walk-in customer to Snepr.
QR join	Customer scans salon QR to open its queue flow.
Remote join	Customer joins through Snepr before physically arriving.
Queue position	Customer's place in current queue.
ETA / estimated turn time	Approximate time when customer may be served; not a guarantee.
Queue freshness	How recently salon updated queue state.
No-show	Customer did not arrive/respond within stated grace period.
Pause queue	Stop new entries while preserving existing entries.
Idempotency	Repeated identical join requests do not create duplicate tokens.
Plan entitlement	Backend rule deciding which features/limits a subscription includes.
Fair-use limit	Reasonable use boundary controlling variable service costs.
Verified review	Review linked to an eligible completed visit.
Snepr Points ledger	Record of every point earning, redemption, expiry and reversal.
Virtual try-on	Generated preview of a possible hairstyle on customer image; illustrative, not guaranteed.

APPENDIX B. SOURCE MATERIALS CONSOLIDATED

- Snepr_Complete_Product_and_Subscription_Strategy_Report.pdf.
- Snepr_Feature_Strategy_and_Bhubaneswar_Salon_Market_Report.pdf (research snapshot 29 October 2026).
- Snepr-Customer-App-Refined-Liquid.html and Snepr-Customer-App-UI-Download.html.

APPENDIX C. ONE-PAGE COMPLETE UNDERSTANDING

Snepr is a salon discovery and queue-visibility platform. A customer discovers a salon, checks service and price information, and joins the queue manually through staff, by QR or remotely through Snepr. The backend creates the token. The salon manages the token from its dashboard as the customer waits, is called, receives service and completes the visit. Intermediate and Pro customers can see the live queue, people ahead and an approximate turn time with a ±5-minute target, plus turn notifications. Entry still has full essential queue operations and all three joining methods, but not customer-facing live ETA tracking. AI Smart Styling is not included in Entry; Intermediate has 3 basic recommendation attempts; Pro has the complete AI styling package. Subscription prices are ₹199, ₹400 and ₹449 per month. Priority Queue and Salon Membership are separate customer-facing features. Snepr's brand is the original rounded wordmark with the three-bar bronze E, in espresso, bronze, ivory and sand. Its master tagline is "Your Time. Your Style. Your Snepr." and its functional promise is "Know the Queue Before You Go." The first market is Bhubaneswar, beginning with a focused Patia–KIIT–Infocity pilot, subject to verified salon onboarding and product readiness.

END OF MASTER REPORT
